

Project Synopsis

Project Name: Airline Reservation System

Abstract:

Airline reservation System is a computerized system used to store and retrieve information and conduct transactions related to air travel. The project is aimed at exposing the relevance and importance of Airline Reservation Systems. It is projected towards enhancing the relationship between customers and airline agencies through the use of ARSs, and thereby making it convenient for the customers to book the flights as when they require such that they can utilize this software to make reservations.

Advantages:

The primary advantage of Airlines Reservation System is, it can be used for every type of Airline Company such as small, medium or large. It basically provides an online platform for travellers to book their ticket online. Travellers can compare prices of different flights for the same route through Airlines Reservation System. It automatically gives you a list of options once details are entered. Due to cut-throat competition in the airline industry, every company offers hefty discounts on flights to its customers. Thus with airlines reservation system travellers can choose best deals and offers. It is also easy to book support through chat and calls, mobile availability, send automated tickets to the customer by mail easy refund policies, available for both domestic and international airlines.

Project scope:

The Airline Reservation System project is an implementation of a general Airline Ticketing website like Orbitz Airlines which helps the customers to search the availability of flights, book and cancel the flight tickets. This project also covers adding, deleting or modifying the customer details and flights.

Modules:

1. Booking module: This has two sub modules namely: Reservation and

Cancellation.

2. Reservation: This module lets passenger to create a new passenger profile and book ticket on an available flight.
3. Cancellation: this module allows the use to cancel a previously booked ticket.
4. Reports module: This module has two sub-modules:
 - a. Confirmed Passenger List: This is a list of all the passenger, whose tickets are confirmed, i.e., the ticket has been successfully booked.
 - b. Waiting List: This is the list of the passenger whose tickets are yet to be confirmed for booking.

Software Requirements:

- FRONT END: HTML
- JAVA SCRIPT
- Technologies: CORE JAVA
- DATABASE: SQL
- Operating System: Windows XP/7/8/10

Hardware Requirements:

- Processor: Intel Pentium based system
- Processor speed: 250 MHz to 833MHz
- RAM SPEED: 1GB

Limitations of the Software:

The limitations of these software is that it is time consuming accuracy, high cost, security problems, etc. There are many problems in existing systems like: Manpower , High cost ,Time and speed , Security, Complexity , Maintenance , Accuracy , Storing Records might get lost or be insufficient due to manual errors. Maintaining and managing data is very costly and time consuming because there are many documents that have to be maintained

by each branch and copies have to be transferred to relative branches. Transfer of information within the branches is costly and time consuming.

Future Enhancement

We have decided to further enhance with a seat reservation available. It is to full fill passengers request to sit where they prefer. They are allowed to choose their seat whether near to window's seat or in the middle.
